CoinPicks Market Direction
Research Package

Five pillars — four researched narratives and one pure-math read of the Bitcoin chart — scored on one standard, blended into one table, and distilled to one number. Everything in this folder is current as of **July 11, 2026**.

THE FINAL NUMBER · JULY 11, 2026 · BTC $64,128

+1.06 **Mild Bull — time-arbitraged**

Equal-weight mean of the five window signals below — every pillar counts 20% (scale −10 to +10; horizon-weighted variant +1.53). Positive because the far windows outweigh the near ones — **not a buy-today signal**: the same table says Mild Bear for the next month. It is a "the storm is priced, the recovery isn't" number.

THE FIVE WINDOWS UNDERNEATH IT

WINDOW	MASTER SIGNAL	CALL
1 month	−0.64	**Mild Bear** — Fed still the drag; CPI July 14; Iran talks live but MoU still "over"
3 months	−0.26	**Neutral** — Sept-hike window + the historical final-flush quarter
6 months	+0.66	**Mild Bull** — basing; DTCC October + Nasdaq Dec 6 + peak hawkishness passes
1 year	+2.34	**Bull** — the first window where all five pillars agree
3 years	+3.19	**Strong Bull** — law + adoption + cycle + valuation

Bands: |s| < 0.5 Neutral · < 1.5 Mild · < 3 Bull/Bear · < 5 Strong · else Very Strong. The Mild Bull conclusion survives dropping any single pillar (leave-one-out: +0.65 to +1.49).

Reading order

Twenty minutes to the whole picture; each report stands alone and can be checked independently — every fact is dated with sources on its last page.

#	FILE	WHAT IT IS
1	`CoinPicks_Master_Direction_Report.pdf`	**The summary.** The final number, the five-window table, the full pillar matrix, where the lenses agree/fight, six weeks of dated triggers, sensitivity.
2	`CoinPicks_Bitcoin_TA_Quant_Pillar_Report.pdf`	**The math pillar.** 7 indicators on 16 years of data, halving-cycle analogs, power-law valuation — with charts. Fully reproducible from code.
3	`reports/current/pdf/ — the four pillar PDFs`	**The story pillars.** CLARITY Act · Iran War Risk · Tokenization RWA · Fed & Macro. Each: thesis, dated facts, honest bear case, dated triggers, and the full score lineage (June → Jul 8 → Jul 10 → Jul 11).
4	`reports/archive/ + prior-work/`	Every earlier version, preserved untouched — the score history is fully auditable.
—	`run.py · engine/blend.py · data/master_blend.json`	The blend engine (runnable Python — reproduce any score set with run.py blend --set NAME), its output, and README.md for regeneration.

How the scoring works — one paragraph

Every pillar answers the same question on five windows (1 month / 3 months / 6 months / 1 year / 3 years): **P** = the odds (0–100) that this force is *good for crypto* by then, **Quality** = how trustworthy the evidence is (0–1), and **Impact** = how hard this force moves the whole market (0–10). These combine into a **Signal = ((P − 50) ÷ 50) × Quality × Impact** (Impact is a uniform 8 for every pillar), so a coin-flip view scores zero no matter how loud the headlines are, and weak evidence can't shout. **All five pillars are equal-weighted** — the master for each window is the simple mean of the five signals (20% each; add a pillar and it auto-rebalances to 1/N) — and the Final Number averages the five master windows.

The five pillars at a glance (July 11 draft P's)

PILLAR	1MO	3MO	6MO	1YR	3YR	ONE-LINE READ
CLARITY Act (law)	52	55	61	82	92	Senate now targets a concrete July 20 floor vote; Polymarket odds ticked up to ~46-47%
Iran War Risk	44	50	57	70	83	No new strikes since Jul 8-9; Oman-mediated Hormuz talks active, but MoU still "over"
Tokenization (RWA)	54	59	65	74	85	Treasuries \$15.16B→\$15.58B in a day; BUIDL jumped to \$2.87B — pipeline still densest of the five
Fed & Macro	34	36	44	53	61	Held flat — no fresh H.4.1/claims data since Jul 10 (next H.4.1 Jul 16)
Bitcoin TA (quant)	39	38	47	67	70	200-week reclaim holding; 6-mo cycle analog flipped 0/3→1/3 positive as alignment shifted a day (n=3 — soft, still net negative)

P values shown (50 = coin flip). Fed & Macro (judged, held flat) and Bitcoin TA (computed) remain close through 6 months — 44 vs 47, a 3-point gap.

Status & honesty notes

- **Score status:** July 11 scores are evidence-driven **drafts awaiting the author's stamp**; every report prints the full lineage (June committed → July 8 → July 10 → July 11). Nothing hides its history.
- **Verification:** facts researched with primary-source discipline (Fed releases, Senate schedule, DOL data, exchange APIs, prediction-market APIs), independently fact-checked, and the whole package forensically audited (243-claim audit July 8; re-audited July 10 and July 11 on the updates); score math recomputed independently; price data cross-checked across two exchanges; models that failed out-of-sample testing were excluded and say so.
- **Known limits, in print inside the reports:** cycle-analog claims rest on 3 completed cycles (and the reports show a live example of that fragility — the 6-month analog flipped 0/3→1/3 between Jul 10 and Jul 11 alone); the TA pillar caps its own conviction at P = 50 ± 25; single-source items are labeled in-line; current chart bars are partial and the completed-bar numbers are printed.
- **The near-term calendar is the test:** CPI Jul 14 · GENIUS rules Jul 18 · CLARITY floor vote targeted Jul 20 · FOMC Jul 29 · Senate recess Aug 7 · MoU expiry ~Aug 16. Each pillar's trigger table says in advance what each outcome does to the scores.

This is research and education, not financial advice. The scores are probabilistic opinions with dated evidence — built to be argued with. If you check one thing manually, check the trigger tables: they are the falsifiable part.
