

CoinPicks Market Direction

Research Package

Five pillars — four researched narratives and one pure-math read of the Bitcoin chart — scored on one standard, blended into one table, and distilled to one number. The qualitative narrative is current as of **October 3, 2026** — a FULL WEEKLY refresh, score set 2026-10-03_draft2, **LEFT AS DRAFT and awaiting Alex's stamp**, measured against the Sept 26 committed baseline (2026-09-26_draft3). The computed Bitcoin TA pillar and the blend below were recomputed the same day on data through the Oct 3 session.

DRAFT — AWAITING ALEX'S STAMP. OCTOBER 3, 2026 (FULL WEEKLY refresh, score set 2026-10-03_draft2). Full weekly refreshes are *categorically* excluded from the delegated auto-stamp authority in CLAUDE.md — the weekly is Alex's own review checkpoint — so this one stays draft until he signs it off, however well sourced it is. **ALL FOUR qualitative pillars moved this cycle, and they very nearly cancelled — which is the finding, not an absence of one. Fed & Macro re-rated UP** (27/25/34/43/58 → 35/29/37/44/58), its first upward move in weeks: August PCE undershot and the September jobs report came in at +29,000, so the October 27–28 rate hike is now priced out. Against it, three cuts. **CLARITY Act** (15/28/45/72/92 → 10/26/44/72/92): the Senate held its last votes Sept 30 without touching the bill and is adjourned until Nov 9, so the next month contains *zero* Senate legislative days. **Iran War Risk** (1/2/15/34/66 → 1/1/14/33/66) as the UN-sidelines talks hit a stalemate. **Tokenization** (57/65/70/77/86 → 56/64/70/77/86) on a further fall in tokenized Treasuries with DTCC's October launch confirmed not yet live. **Four independent adversarial-verification passes ran, one per pillar, and they changed the output in both directions** — they made the Tokenization cut *smaller*, and they withdrew three claims carried in previously delivered reports as false: Brent's late-September price levels (futures prints had been captioned as the official spot series, understating oil by \$12–14 a barrel), jobless claims being "near 57-year lows," and a securities order's "30-day public comment" period. The leave-one-out range still changes sign depending on which single pillar you remove, so the headline is fragile by construction. **MERGE NOTE — TWO independent full weekly refreshes ran for October 3, the same duplicate-cycle failure mode the runbook documents for Sept 26.** The cloud routine researches the day itself unless it can already see the day's commit on the shared repo; this run's commit was still local, so it researched independently and pushed first. **Origin's lineage is authoritative and untouched** — its set keeps the key 2026-10-03_draft — so this package is 2026-10-03_draft2 and archives as 2026-10-03-2. **The divergence needs Alex's decision:** the cloud's weekly moved ONLY Fed & Macro (to 30/27/35/43/58) and held the other three flat, while this package moves all four. **On Fed & Macro the two independent passes AGREE ON DIRECTION and differ on size** — the cloud took +3 on the 1-month window, this package +8 — which is genuine corroboration that the pillar should rise. On the other three pillars this package diverges alone, each cut resting on a dated primary fact. It is also the package with four independent adversarial-verification passes behind it, which withdrew three false claims from previously delivered reports.

THE FINAL NUMBER · OCTOBER 3, 2026 (FULL WEEKLY REFRESH, 2026-10-03_DRAFT2, DRAFT — AWAITING ALEX’S STAMP) · BTC \$84,858.11 ON OCT 3

−0.07 Neutral — four pillars re-rated and the number moved one hundredth

Equal-weight mean of the five window signals below — every pillar counts 20% (scale −10 to +10). The headline reads −0.07, against −0.08 on the Sept 26 committed baseline; the horizon-weighted variant reads **+0.48**, against +0.47. Both are **Neutral**, and **no call band flipped anywhere** — not on a single window, not on either final-number variant. **Read that carefully, because it is this cycle’s headline finding and it is not “a quiet week”**: all four qualitative pillars were re-rated on fresh primary-source evidence, one of them by eight points, and the blend landed within a hundredth of where it started. Fed & Macro’s improvement was almost exactly consumed by the cuts to CLARITY Act, Iran War Risk and Tokenization. A number sitting near zero is *not* a forecast that nothing happens — it is five forces of real size pulling against each other, a **Bear** 1-month read held against a **Bull** 3-year read. BTC \$84,858.11 (Oct 3 partial session; the Oct 2 close was \$84,500.84).

THE FIVE WINDOWS UNDERNEATH IT

WINDOW	MASTER SIGNAL	CALL
1 month	−2.17	Bear — barely changed from −2.15, but the composition changed completely. Fed & Macro <i>improved</i> sharply to −2.04 from −3.13 as the October FOMC repriced to a hold — and that gain was almost exactly consumed by CLARITY falling to −5.44 (zero Senate legislative days in this window) and Tokenization easing to +0.86. Iran held at −4.70, already at its floor. CLARITY is still the single biggest weight.
3 months	−1.60	Bear — marginally better than −1.63, band unchanged. Fed improved to −2.86 but took only +4 points of P, because the Dec 8–9 FOMC is <i>inside</i> this window and a December hike is still the market’s base case. Iran slipped to −5.10, CLARITY to −3.26
6 months	−0.55	Mild Bear — from −0.59. Fed improved to −1.66 on cooler core PCE and slower wage growth; Iran slipped to −4.03; Tokenization HELD at +2.72 after its 6-month cut was withdrawn on verification
1 year	+1.14	Mild Bull — essentially unchanged from +1.15. Tokenization leads at +3.37, alongside CLARITY (+3.17) and Bitcoin TA (+1.63). Fed took only +1 point of P here: a 10-year yield at 5.24–5.29% is a structural drag that cooler monthly prints do not fix
3 years	+2.82	Bull — <i>identical</i> , and every pillar still positive. Every qualitative pillar was deliberately held at this horizon: nothing in a week of meeting dates and one month of data speaks to 2029. A unanimously positive long end against a Bear 1-month read is the most important shape in this package

Bands: |s| < 0.5 Neutral · < 1.5 Mild · < 3 Bull/Bear · < 5 Strong · else Very Strong. The leave-one-out range this cycle is −0.74 to +0.62 — the sign flips positive (Mild Bull) when Iran War Risk is dropped (+0.62), and **dropping Tokenization alone pushes the reading to −0.74, Mild Bear**. With the headline at −0.07, removing any single pillar swings it by far more than the number itself. That is the honest state of the blend — see the Master Report’s Robustness section.

Reading order

Twenty minutes to the whole picture; each report stands alone and can be checked independently — every fact is dated with sources on its last page.

#	FILE	WHAT IT IS
1	CoinPicks_Master_Direction_Report.pdf	The summary. The final number, the five-window table, the full pillar matrix, where the lenses agree/fight, six weeks of dated triggers, sensitivity.
2	CoinPicks_Bitcoin_TA_Quant_Pillar_Report.pdf	The math pillar. 7 indicators on 16 years of data, halving-cycle analogs, power-law valuation — with charts. Fully reproducible from code.
3	reports/current/pdf/ — the four pillar PDFs	The story pillars. CLARITY Act · Iran War Risk · Tokenization RWA · Fed & Macro. Each: thesis, dated facts, honest bear case, dated triggers, and the full score lineage (June committed → ... → Sept 23 committed → Sept 26 draft, this version).
4	reports/archive/ + prior-work/	Every earlier version, preserved untouched — the score history is fully auditable.
—	run.py · engine/blend.py · data/master_blend.json	The blend engine (runnable Python — reproduce any score set with <code>run.py blend --set NAME</code>), its output, and README.md for regeneration.

How the scoring works — one paragraph

Every pillar answers the same question on five windows (1 month / 3 months / 6 months / 1 year / 3 years): **P** = the odds (0–100) that this force is *good for crypto* by then, **Quality** = how trustworthy the evidence is (0–1), and **Impact** = how hard this force moves the whole market (0–10). These combine into a **Signal** = $((P - 50) \div 50) \times \text{Quality} \times \text{Impact}$ (Impact is a uniform 8 for every pillar), so a coin-flip view scores zero no matter how loud the headlines are, and weak evidence can't shout. **All five pillars are equal-weighted** — the master for each window is the simple mean of the five signals (20% each; add a pillar and it auto-rebalances to 1/N) — and the Final Number averages the five master windows.

The five pillars at a glance (FULL WEEKLY refresh, September 26 — score set 2026-09-26_draft3, COMMITTED BY ALEX, September 27, 2026)

PILLAR	1MO	3MO	6MO	1YR	3YR	ONE-LINE READ
CLARITY Act (law)	10	26	44	72	92	RE-RATED DOWN from 15/28/45/72/92 — and this is now arithmetic, not forecast. The “one session week left” flagged last cycle has passed with no CLARITY action : the Senate’s final votes were Sept 30 (roll calls 253–256, verified on senate.gov), it convened pro forma Oct 1 with “no business conducted,” and it now stands adjourned until Nov 9 at 3:00 p.m. — after the 1-month window closes. The Nov 9 agenda is H.R. 2347, not the CLARITY Act. 12mo and 36mo HELD: nothing about the 2027 new-Congress path changed
Iran War Risk	1	1	14	33	66	RE-RATED DOWN from 1/2/15/34/66. The indirect UN-sidelines track hit a stalemate Sept 28 and Iran’s delegation left New York, removing the “talks are still live” grounds for sitting a point above the floor. Brent corrected : official EIA/FRED spot was \$113.96 (Sept 29), not the ~\$104 printed previously. Four vessels were struck Sept 28–29 and more since — but by “unknown projectile,” with no claim of responsibility, so attribution to Iran is not established , and with zero casualties
Tokenization (RWA)	56	64	70	77	86	CUT one point on 1mo and 3mo. Tokenized US Treasuries fell again, \$14.94B → \$14.77B (–7.30%/30d), and DTCC’s October launch is confirmed NOT yet live . The 6-month cut was <i>withdrawn</i> after verification: the “four consecutive negatives” series is not apples-to-apples (the aggregator changed scope from 87 products to 25 assets), and GENIUS got its first binding interim final rule Sept 30
Fed & Macro	35	29	37	44	58	RE-RATED UP from 27/25/34/43/58 — the largest move this cycle and the first upward one in weeks. August PCE undershot at 3.4% headline / 3.0% core (BEA, Sept 30), September payrolls came in at +29,000 with unemployment up to 4.2% and 60,000 of downward revisions (BLS, Oct 2), and Vice Chair Jefferson said judgment “may take more time” (Oct 1). October’s hike is priced out — but December is still the base case, and the 10-year rose to 5.29%, so this is a deferral, not an all-clear
Bitcoin TA (quant)	54	61	62	67	68	Computed, unchanged methodology (BTC \$84,858.11, Oct 3 partial session, from \$84,500.84 at the Oct 2 close). Full local quant refresh Oct 3 — weekly, monthly and quarterly bars are all PARTIAL, so the completed-bar composites are quoted alongside them in the TA report (+56.3 / +15.7 / +31.1)

P values shown (50 = coin flip). All four qualitative pillars were researched from primary sources this cycle, then every load-bearing claim was re-derived independently in **four** adversarial-verification passes, one per pillar. **All four moved** — Fed & Macro up, the other three down — and the verification changed the output in both directions, including making the Tokenization cut smaller than first scored and withdrawing three false claims inherited from earlier delivered reports. The Bitcoin TA pillar is computed by the pipeline and never hand-edited.

Status & honesty notes

- Score status — today was a FULL WEEKLY refresh, and it is DELIBERATELY UNSTAMPED. It is waiting for Alex.** One new score set, 2026-10-03_draft2, measured against the Sept 26 committed baseline (2026-09-26_draft3, stamped by Alex September 27). **All four qualitative pillars re-rated** — Fed & Macro *up* (27/25/34/43/58 → 35/29/37/44/58), CLARITY Act down (15/28/45/72/92 → 10/26/44/72/92), Iran War Risk down (1/2/15/34/66 → 1/1/14/33/66), Tokenization down (57/65/70/77/86 → 56/64/70/77/86) — and they very nearly cancelled, which is why the headline moved one hundredth. Per CLAUDE.md, full weekly refreshes are *categorically* excluded from the delegated auto-stamp authority — independent of how large the moves are or how good the sourcing is — because the weekly is Alex's own review checkpoint. This run was unattended, so nobody has reviewed these numbers yet. Status in `config/scores.json`: draft, with no `stamped_by` field. **Treat the number as provisional until he signs it off** — and see the Master Report's My Decision section for the five specific things flagged for his attention, starting with the Brent price correction.
- Read this first if you read nothing else: an earlier cycle was interrupted, and it matters for trust.** A Sept 24 cycle wrote a score set and edited all six reports, but was never rendered, selfchecked, archived or committed — and its report text nonetheless asserted "COMMITTED · AUTO-STAMPED" in every decision stamp for a set that was still draft in the data file. `run.py selfcheck` catches exactly that, and did, twelve times. This cycle treats it as not-delivered (the house rule for abandoned drafts), independently re-verifies its claims instead of trusting them, and drops it from the visible lineage while leaving it in `scores.json` forever. **The re-verification cut both ways:** its two Fed claims held up in full, its Iran claim was falsified on a point of fact, and its Tokenization judgement was found one-sided and is reversed here.
- Heads-up before you compare notes: TWO independent weekly refreshes ran for today, and three score sets carry today's date.** The cloud routine researches the day on its own unless it can already see the day's commit on the shared repo — this run's commit was still local when it went, so it ran independently and pushed first. Its sets are 2026-09-26_draft (a daily cycle, committed and auto-stamped) and 2026-09-26_draft2 (its own weekly); this package is 2026-09-26_draft3. Nothing of the cloud's was edited or overwritten. **The good news:** on Fed & Macro the two independent passes landed within a point of each other on every window — the cloud read **27/25/35/43/57** against this package's **27/25/34/43/58**, identical on the 1-month, 3-month and 1-year windows. Two separate primary-source passes converging that tightly is genuine corroboration of the biggest move this cycle, and it is reported rather than averaged away. **Alex has now settled this:** they disagreed on Iran (how far to reverse) and on Tokenization (whether to cut the near window). After reviewing both, Alex committed this set — the one with the adversarial verification behind it — as the canonical weekly on September 27, 2026.
- Why Fed & Macro moved most, so you can judge it yourself.** Not one headline — a week, and mostly primary sources. Fed Governor Michael Barr, Sept 23, in a speech whose text was extracted from the Fed's own PDF: "inflation is above our 2 percent target and not clearly trending toward target in a timely way" and "in my base case, further policy adjustments are likely to be needed." The S&P Global flash US PMI, from the embargoed release: strongest private-sector growth since July 2021 *paired with* the fastest input-cost inflation since October 2022. The University of Michigan's final September survey: year-ahead inflation expectations 4.0% → 4.6% and, more importantly, *long-run* expectations 3.3% → 3.4%, breaking three straight months — that is the de-anchoring risk that extends a tightening cycle past one meeting. Plus jobless claims at 197,000 and Fed reserve balances down \$83.6B in a single week. **Honest counterweight:** growth is strong, layoffs are historically low, new home sales rose, and the reserve drain is largely a mechanical Treasury-account rebuild — which is why the cut is single-digit and barely touches the 1-year and 3-year windows.
- Why Iran War Risk went both ways at once.** Iran's foreign minister, Abbas Araghchi, stood outside the UN Security Council on Sept 25 and put a specific seven-day plan on the record, conveyed via Qatar: the US lifts the blockade, waives oil sanctions and releases an estimated \$12bn in frozen assets over about four to five days, the Strait of Hormuz reopens on day six, and nuclear talks begin on day seven. That is a named official on the record, carried by AP, Reuters and Al Jazeera independently — a real upgrade over the anonymous sourcing of previous weeks. Because the midterms are Nov 3, a post-election deal falls *outside* the 1-month window and *inside* the 3-

and 6-month ones, so those windows move in opposite directions. **The move is deliberately small, because the up-move rests on statements while the confirmed actions run the other way:** a cargo vessel was struck in Hormuz on Sept 23 with two casualties, Saudi Arabia was fired on twice, the naval blockade is intact, Hormuz traffic is still only about 9–18 ships a day against roughly 125 before the war, and Brent is back above \$100.

- **Why Tokenization was cut even though it had good news.** Months ago this pillar wrote down a specific promise: a third consecutive negative reading on tokenized US Treasuries “would be a genuine trend worth re-rating on.” It got one — \$14.94B, down 6.95% over 30 days, after two smaller declines, roughly seven times the previous magnitude. Acting on a trigger you committed to in advance is the whole point of writing it down, so the near window came down a point. The abandoned Sept 24 draft had gone the *other* way on a New York Stock Exchange / Blockchain.com agreement; that agreement is real, but it is non-binding, needs regulatory approval, has no launch date, and the venue is not live — and this pillar’s own standard says the trigger is a venue actually going live. Taking the good news while ignoring the bad would have been one-sided.
- **Why CLARITY held flat — and what was wrong in the last report.** Nothing new cleared the bar, and the Senate has one session week left (Sept 28 – Oct 2) before a five-week recess with no re-vote scheduled. But four things in the fact record needed fixing, and one was serious: **the report stated the opposite of a primary source.** It said the final bill text does *not* require divestment or a blind trust; Senator Lummis’s own summary of that text says there is a “clear requirement for covered individuals to divest significant financial interests or place in a qualified blind trust.” The honest version is that the requirement is real but delayed. Also fixed: the stablecoin-yield fight is not unresolved (the text has a Treasury circuit breaker that expires 18 months after enactment); Senator Tillis, not Senator Thune, filed the motion to reconsider; and the report never mentioned that *four Republicans* voted against cloture, which is a harder read than blaming the failure entirely on Democrats.
- **What was deliberately NOT counted, in both directions.** This is where the rules earn their keep. A Wall Street Journal report that Trump *rejected* Iran’s seven-day plan rests on unnamed officials in a single outlet, with everyone else citing the WSJ and no on-record White House position — so it was reported but not scored, even though it argues *against* the up-move taken here. Also reported but not scored: a 60-day “road map” story that is still single-sourced; the Pentagon’s 19th US death, which is non-hostile and therefore does not fire the combat-death trigger; prediction-market odds on CLARITY (6.45%, on \$12,700 of daily volume — an effectively dead market) and on the midterms, which are market prices, not institutional forecasts, and are never mixed with them; and a new BlackRock-strategy tokenized product that is restricted to non-US investors, the same ground on which two earlier launches were excluded.
- **Verification, and one finding worth knowing:** every load-bearing new claim was re-derived from primary sources in two adversarial passes, deliberately not trusting the research’s own citations — and they overturned findings in *both* directions, restoring two claims that had been wrongly “corrected” and falsifying three that had been accepted. Along the way: the automated page-fetching tool was caught failing silently on PDFs and very large files, both denying a sentence that was really there and reporting numbers a source does not contain. Verbatim quotes from PDFs in this system now require local text extraction. Two facts could not be primary-verified because their sources block automated access — the Sept 23 Hormuz vessel strike and the “no US strikes since Sept 1” status — and both are labelled as wire-derived rather than presented as primary. Neither drives a score change on its own.
- **Known limits, in print inside the reports:** cycle-analog claims rest on 3 completed cycles ($n=3$), so direction is the signal and levels are soft; the current weekly, monthly and quarterly bars are PARTIAL and the completed-bar composites are quoted alongside them; the power-law fair value (\$141,272, about 41% above today’s price) swings with its fit window, so it is quoted as a range (\$119k–\$146k across 2011–2015 start years) and never as a target; the quant pillar’s P is capped at 50 ± 25 by design because measured technical edge is modest, and a 5-feature crash model that failed out-of-sample (AUC 0.44) stays excluded; froth data lags about six weeks and is a robustness tilt only, never a score input.
- **The near-term calendar, in order of what actually matters:** August PCE and the Q2 GDP third estimate landed **Sept 30** — core PCE printed 3.0% y/y (a chunk of the apparent cooling is a telegraphed BEA methodology

change, not fresh disinflation) and GDP was revised sharply up to +2.2%; the two cut against each other and neither cleared the sufficiency bar for a re-rate (see the Fed & Macro report's What Changed) · the Senate's last pre-recess week, Sept 28 – Oct 2, closed with no re-vote scheduled · whether the US answers Iran's seven-day plan on the record · whether any venue actually goes live under the SEC's tokenized-stock exemption (earliest ~mid-October), and whether tokenized Treasuries fall for a fourth reading · the Oct 27–28 FOMC.

This is research and education, not financial advice. The scores are probabilistic opinions with dated evidence — built to be argued with. If you check one thing manually, check any pillar's What Changed section this cycle — each ran independent fresh research and is honest about finding nothing that cleared the bar, rather than manufacturing a move. The Iran War Risk pillar's trigger table is worth a look too: it flags the next scheduled US-Iran meeting as the clearest near-term trigger to watch next cycle.
