

CoinPicks Market Direction

Research Package

Five pillars — four researched narratives and one pure-math read of the Bitcoin chart — scored on one standard and blended into a single direction table. Everything in this folder is current as of **July 8, 2026**.

THE BOTTOM LINE (JULY 8, 2026 · BTC \$62,274)		
WINDOW	MASTER SIGNAL	CALL
1 month	-1.08	Mild Bear — broken tape, hawkish Fed, Iran shooting
3 months	-0.79	Mild Bear — the historical final-flush window
6 months	+0.18	Neutral — basing; catalysts stack up late
1 year	+2.11	Bull — the first window where all five pillars agree
3 years	+2.67	Bull — law + adoption + cycle + valuation

Signal scale -10 (max bear) to +10 (max bull). |s| < 0.5 Neutral · < 1.5 Mild · < 3 Bull/Bear · < 5 Strong · else Very Strong.

Reading order

Twenty minutes to the whole picture; each report stands alone.

#	FILE	WHAT IT IS
1	CoinPicks_Master_Direction_Report.pdf	The summary. All five pillars in one table, where they agree and fight, the next six weeks of triggers, and sensitivity checks. If you read one file, read this.
2	CoinPicks_Bitcoin_TA_Quant_Pillar_Report.pdf	The math pillar. Pure Bitcoin technical analysis — 7 indicators on 16 years of data, halving-cycle analogs, a power-law valuation model — with charts. Fully reproducible from code.
3	Pillar Reports (updated 2026-07-08)/ – 4 PDFs	The story pillars. CLARITY Act (US crypto law) · Iran War Risk · Tokenization of Real-World Assets · Fed & Macro. Each: thesis, dated facts with sources, the honest bear case, dated triggers, and scores.
4	June 2026 Originals (for the record)/	The previous versions (committed June 12–19, 2026), preserved untouched so every score's history is auditable.
—	master_blend.py · master_blend.json · README.md	The blend engine (runnable Python), its output, and technical regeneration instructions.

How the scoring works — one paragraph

Every pillar answers the same question on five windows (1 month / 3 months / 6 months / 1 year / 3 years): **P** = the odds (0–100) that this force is *good for crypto* by then, **Quality** = how trustworthy the evidence is (0–1), and **Impact** = how hard this force moves the whole market (0–10). These combine into a **Signal** = $((P - 50) \div 50) \times \text{Quality} \times \text{Impact}$, so a coin-flip view scores zero no matter how loud the headlines are, and weak evidence can't shout. The four story pillars (weighted 25/25/30/25) blend into a qualitative signal; the Bitcoin TA pillar is the quantitative signal; the master is 50/50 of the two — and the calls above hold at 60/40 and 40/60 as well.

The five pillars at a glance (July 8 scores)

PILLAR	1MO	3MO	6MO	1YR	3YR	ONE-LINE READ
CLARITY Act (law)	52	56	61	83	92	A timing fight, not a survival fight — ethics deal decides July
Iran War Risk	40	47	55	70	83	Ceasefire broke July 8 — near-term risk, historically a dip to buy
Tokenization (RWA)	52	56	62	73	85	Adoption at records, catalysts slipping in timing, thesis intact
Fed & Macro	35	36	42	52	61	Liquidity is the tide and it's out — hike risk before any pivot
Bitcoin TA (quant)	37	37	46	67	70	Tape broken now; at this cycle-month, prior cycles were 3-for-3 up in 12 months

P values shown (50 = neutral coin flip). Full Quality/Impact/evidence inside each report. Note the two most independent methods — a human reading the Fed and a pipeline reading candles — landed within two points of each other on every window through 6 months.

Status & honesty notes

- Score status:** the July 8 scores are evidence-driven **drafts awaiting the author's stamp**; each report shows the last stamped (June) scores beside them. Nothing here hides its history.
- Dates:** every report carries its full lineage — written · committed · updated — and every fact inside is dated with sources listed on its last page.
- Verification:** facts were researched, adversarially re-verified, and then **forensically audited** (243 claims independently re-checked against primary sources on July 8; the handful of date, attribution, and sourcing errors found were corrected in this version); score math recomputed independently; price data cross-checked across two exchanges; models that failed out-of-sample testing were excluded and say so in the reports.
- Known limits:** cycle-analog claims rest on only 3 completed Bitcoin cycles; the TA pillar caps its own conviction (P stays within 50 ± 25) because technical analysis has a modest measured edge; two sources (congress.gov direct pull, live Kalshi) were rate-limited and are flagged as secondhand where used.

This is research and education, not financial advice. The scores are probabilistic opinions with dated evidence — they are built to be argued with. Check the trigger tables in each report: they say in advance what events would prove each call wrong.
